

Task 2

For this task, I built my student digital portfolio by creating profiles on GitHub, LinkedIn, and Kaggle. I chose these platforms because they are commonly used by students to showcase their skills and connect with professionals. On GitHub, I made a profile README where I added my basic details like my name, branch, and what I want to learn in the future. I feel this platform will be very useful for uploading and managing my projects as I learn new things.

On LinkedIn, I updated my education details, including my current degree and college. I understand that LinkedIn is important for building a professional network and finding internship opportunities. I also created a Kaggle account to explore data science and practice working with datasets, which I find interesting.

In the coming years, I plan to keep updating these profiles with my projects, skills, and achievements. This will help me create a strong online presence. Overall, this task made me realize how important it is to start building a professional profile early in college.
